Extract detected faces from image in opencv c++ for further processing

Ask Question

I am working on image processing in opencv to detect faces in an image and perform further processing on them.I am stuck at a point where i am trying to analyze the detected faces in the image.I want to pass the detected area of the face to a new function and display only that part of the image but i am getting following error: Invalid argument:"Path Location Typeno match for 'operator=' (operand types are 'cv::Mat' and 'cv::Rect_')"

if possible please suggest me some solution. Thankyou

```
    }
    return 0;
}

void totest(Mat img)
{
    imshow("detected",img);
    cvtColor(img,img,CV_RGB2GRAY);
    cvCanny(img,img,20,100,3);
    imshow("edged",img);

}

void detectAndDisplay( Mat frame )
{
    std::vector<Rect> faces;
    Mat frame_gray;
    std::vector<Rect> fff;
    cvtColor( frame, frame_gray, CV_BGR2GRAY );
    equalizeHist( frame_gray, frame_gray );

    face_cascade.detectMultiScale( frame_gray, faces, 1.1, 3, 0, Size(115,115) );
    int x;

    for( size_t i = 0; i < faces.size(); i++ )
    {
        x++;
        Point center( faces[i].x + faces[i].width*0.5, faces[i].y +
            ellipse( frame, center, Size( faces[i].width*0.5, faces[i].height*0.5), 0, 0,
                Mat img;
                img=faces[i];
            }
```

The problem comes from this line:

```
img = faces[i];
^      ^^^^^^^
|      |
'Mat'  'Rect'
```

where you are trying to assign a `cv::Rect` to a `cv::Mat`.

To get the ROI region of the image, you should change it to something like:

```
img = frame(faces[i]);
```
